Completed	Tuesday, 20 October 2026, 6:44 PM
Duration	10 mins 48 secs
Grade	**10.00** out of 10.00 (**100**%)

Question **1**

Correct

Mark 1.00 out of 1.00

Create a Python program to write to a specific line in a text file, replacing the existing content of that line.

Description:

1. **Input:**
   - A text file with multiple lines.
   - A line number to write to.
   - New content for the specified line.
2. **Output:**
   - The updated file with the specified line replaced by the new content in file "output.txt".

Example:

- **Input File Content:**

  "Line one.
  Line two.
  Line three.
  Line four."
  2

  Updated line two.

Output:

Line one.
Updated line two.
Line three.
Line four.

For example:

Test	Input	Result

`with open('output.txt', 'r') as file:`
`  text = file.read()`
`  print(text)`
	`input1.txt`
	`2`
	`Updated line two.`
		`Line one.`
		`Updated line two.`
		`Line three.`
		`Line four.`

Answer: (penalty regime: 0 %)

```
# Read inputs: input file name, line number, and new text
input_file = input().strip()
line_number = int(input().strip())
new_content = input()

# Read all lines from the original file
with open(input_file, 'r') as file:
    lines = file.readlines()

# Replace the specific line (1-based index)
if 1 <= line_number <= len(lines):
    lines[line_number - 1] = new_content + '\n'

# Write the updated lines to output.txt
with open('output.txt', 'w') as file:
    file.writelines(lines)
```

	Test	Input	Expected	Got	

✓	`with open('output.txt', 'r') as file:`
	`  text = file.read()`
	`  print(text)`
		`input1.txt`
		`2`
		`Updated line two.`
			`Line one.`
			`Updated line two.`
			`Line three.`
			`Line four.`
				`Line one.`
				`Updated line two.`
				`Line three.`
				`Line four.`
					✓

✓	`with open('output.txt', 'r') as file:`
	`  text = file.read()`
	`  print(text)`
		`input2.txt`
		`2`
		`Line B Updated.`
			`Line A.`
			`Line B Updated.`
			`Line C.`
				`Line A.`
				`Line B Updated.`
				`Line C.`
					✓

Passed all tests! ✓

Correct

Marks for this submission: 1.00/1.00.

Question **2**

Correct

Mark 1.00 out of 1.00

Write a Python program to count the frequency of each word in a given text file.

Description:

1. **Input:**
   - String as input.
2. **Output:**
   - A list of words with their corresponding frequency count to be write in a file "output.txt"

Example:

- **Input File Content:**

  apple orange apple banana apple orange

Output:

apple: 3
orange: 2
banana: 1

For example:

Test	Input	Result

`with open('output.txt', 'r') as file:`
`  text = file.read()`
`  print(text)`
	`apple orange apple banana apple orange`	`apple: 3`
		`banana: 1`
		`orange: 2`

Answer: (penalty regime: 0 %)

```
import string

# Read input string directly
text = input()

# Convert text to lowercase and remove punctuation
text = text.lower()
for char in string.punctuation:
    text = text.replace(char, '')

# Split text into individual words
words = text.split()

# Count frequencies
word_counts = {}
for word in words:
    word_counts[word] = word_counts.get(word, 0) + 1

# Write output to output.txt sorted alphabetically by word
with open('output.txt', 'w') as file:
    for word in sorted(word_counts.keys()):
        file.write(f"{word}: {word_counts[word]}\n")
```

	Test	Input	Expected	Got	

✓	`with open('output.txt', 'r')`
	`as file:`
	`  text = file.read()`
	`  print(text)`
		`apple orange apple banana apple orange`	`apple: 3`
			`banana: 1`
			`orange: 2`
				`apple: 3`
				`banana: 1`
				`orange: 2`
					✓

	Test	Input	Expected	Got	

✓	`with open('output.txt', 'r')`
	`as file:`
	`  text = file.read()`
	`  print(text)`
		`Hello world! Hello everyone. Welcome to the world of programming.`	`everyone: 1`
			`hello: 2`
			`of: 1`
			`programming: 1`
			`the: 1`
			`to: 1`
			`welcome: 1`
			`world: 2`
				`everyone: 1`
				`hello: 2`
				`of: 1`
				`programming: 1`
				`the: 1`
				`to: 1`
				`welcome: 1`
				`world: 2`
					✓

✓	`with open('output.txt', 'r')`
	`as file:`
	`  text = file.read()`
	`  print(text)`
		`One fish two fish Red fish blue fish`	`blue: 1`
			`fish: 4`
			`one: 1`
			`red: 1`
			`two: 1`
				`blue: 1`
				`fish: 4`
				`one: 1`
				`red: 1`
				`two: 1`
					✓

Passed all tests! ✓

Correct

Marks for this submission: 1.00/1.00.

Question **3**

Correct

Mark 1.00 out of 1.00

Create a Python program to delete a specific line from a text file based on a given line number.

Description:

1. **Input:**
   - A text file with multiple lines.
   - A line number to delete.
2. **Output:**
   - The updated file with the specified line removed in file "output.txt".

Example:

- **Input File Content:**

  "Line one.
  Line two.
  Line three.
  Line four."
  2

  Updated line two.

Output:

Line one.
Line three.
Line four.

For example:

Test	Input	Result
with open('output.txt', 'r') as file: text = file.read() print(text)	input1.txt 2	Line one. Line three. Line four.

Answer: (penalty regime: 0 %)

```
# Read input parameters
file_name = input().strip()
line_to_delete = int(input().strip())

# Read all lines from the specified input file
with open(file_name, 'r') as file:
    lines = file.readlines()

# Remove the line if the line number is within valid range (1-based index)
if 1 <= line_to_delete <= len(lines):
    lines.pop(line_to_delete - 1)

# Write the remaining lines to output.txt
with open('output.txt', 'w') as file:
    file.writelines(lines)
```

	Test	Input	Expected	Got	
✓	with open('output.txt', 'r') as file: text = file.read() print(text)	input1.txt 2	Line one. Line three. Line four.	Line one. Line three. Line four.	✓

	Test	Input	Expected	Got	

✓	`with open('output.txt', 'r') as file:`
	`  text = file.read()`
	`  print(text)`
		input2.txt
		3
			Line A.
			Line B.
				Line A.
				Line B.
					✓

Passed all tests! ✓

Correct

Marks for this submission: 1.00/1.00.

Question **4**

Correct

Mark 1.00 out of 1.00

Develop a Python program to identify and print all palindrome words from a given text file.

Description:

1. **Input:**
   - A text file containing multiple words.
2. **Output:**
   - A list of palindrome words found in the file name as 'output.txt'.

For example:

Test	Input	Result

`with open('output.txt', 'r') as file:`
`  text = file.read()`
`  print(text)`
	input1.txt	madam
		arora
		malayalam

Answer: (penalty regime: 0 %)

```
import string

# Read the input filename
file_name = input().strip()

# Read the content of the file
with open(file_name, 'r') as file:
    content = file.read()

# Extract words and clean punctuation
words = content.split()
palindromes = []

for word in words:
    # Strip punctuation marks attached to words
    clean_word = word.strip(string.punctuation)

    # Check if the word is a palindrome (ignoring case)
    if clean_word and clean_word.lower() == clean_word.lower()[::-1]:
        palindromes.append(clean_word)

# Write the palindrome words to output.txt
with open('output.txt', 'w') as file:
    for word in palindromes:
        file.write(f"{word}\n")
```

	Test	Input	Expected	Got	

✓	`with open('output.txt', 'r') as file:`
	`  text = file.read()`
	`  print(text)`
		input1.txt	madam
			arora
			malayalam
				madam
				arora
				malayalam

Passed all tests! ✓

Correct

Marks for this submission: 1.00/1.00.

Question **5**

Correct

Mark 1.00 out of 1.00

Write a Python program to reverse the contents of a specific line in a text file based on a given line number.

Description:

1. **Input:**
   - A text file with multiple lines.
   - A line number to reverse.
2. **Output:**
   - The updated file with the specified line's contents reversed in file "output.txt".

Example:

- **Input File Content:**

  "Line one.
  Line two.
  Line three.
  Line four."
  3

Output:

Line one.
Line two.
eerht eniL.
Line four.

For example:

Test	Input	Result

`with open('output.txt', 'r') as file:`
`  text = file.read()`
`  print(text)`
	input1.txt
	3
		Line one.
		Line two.
		eerht eniL.
		Line four.

Answer: (penalty regime: 0 %)

```
import string

# Read input parameters
file_name = input().strip()
line_to_reverse = int(input().strip())

# Read all lines from the specified input file
with open(file_name, 'r') as file:
    lines = file.readlines()

# Reverse the content of the specified line (1-based index)
if 1 <= line_to_reverse <= len(lines):
    line = lines[line_to_reverse - 1].rstrip('\r\n')

    # Separate trailing punctuation if present
    if line and line[-1] in string.punctuation:
        content = line[:-1]
        punct = line[-1]
        reversed_line = content[::-1] + punct
    else:
        reversed_line = line[::-1]

    lines[line_to_reverse - 1] = reversed_line + '\n'

# Write the updated lines to output.txt
with open('output.txt', 'w') as file:
    file.writelines(lines)
```

	Test	Input	Expected	Got	

✓	`with open('output.txt', 'r') as file:`
	`  text = file.read()`
	`  print(text)`
		input1.txt
		3
			Line one.
			Line two.
			eerht eniL.
			Line four.
				Line one.
				Line two.
				eerht eniL.
				Line four.
					✓

✓	`with open('output.txt', 'r') as file:`
	`  text = file.read()`
	`  print(text)`
		input2.txt
		2
			Line A.
			B eniL.
			Line C.
				Line A.
				B eniL.
				Line C.
					✓

Passed all tests! ✓

Correct

Marks for this submission: 1.00/1.00.

Question **6**

Correct

Mark 1.00 out of 1.00

Develop a Python program to read a specific line from a text file based on a given line number.

Description:

1. **Input:**
   - A text file with multiple lines.
   - A line number to read.
2. **Output:**
   - The content of the specified line.

input1.txt:

Line one.
Line two.
Line three.
Line four.

For example:

Input	Result
input1.txt 3	Line three.

Answer: (penalty regime: 0 %)

```
file_name = input().strip()
line_number = int(input().strip())

with open(file_name, 'r') as file:
    lines = file.readlines()

# Check if the requested line number is within valid range (1-based index)
if 1 <= line_number <= len(lines):
    print(lines[line_number - 1].rstrip('\r\n'))
```

	Input	Expected	Got	
✓	input1.txt 3	Line three.	Line three.	✓
✓	input2.txt 3	Line C.	Line C.	✓

Passed all tests! ✓

Correct

Marks for this submission: 1.00/1.00.

Question **7**

Correct

Mark 1.00 out of 1.00

Develop a Python program to read a text file and count the total number of words in the file.

Description:

1. **Input:**
   - A text file containing several lines of text.
   - File name you should get as input.
2. **Output:**
   - The total number of words in the file.

For example:

Input	Result
input2.txt	Total words: 14
input3.txt	Total words: 15

Answer: (penalty regime: 0 %)

```
file_name = input().strip()

with open(file_name, 'r') as file:
    text = file.read()

words = text.split()
print(f"Total words: {len(words)}")
```

	Input	Expected	Got	
✓	input1.txt	Total words: 6	Total words: 6	✓
✓	input2.txt	Total words: 14	Total words: 14	✓
✓	input3.txt	Total words: 15	Total words: 15	✓

Passed all tests! ✓

Correct

Marks for this submission: 1.00/1.00.

Question **8**

Correct

Mark 1.00 out of 1.00

Create a Python program to find the longest word in a text file.

- **Input:**
  - A text file containing multiple lines of text.
- **Output:**
  - The longest word in the file.

For example:

Input	Result
input1.txt	Longest word: containing

Answer: (penalty regime: 0 %)

```
import string

# Read the file name from standard input
file_name = input().strip()

# Read the file content
with open(file_name, 'r') as file:
    text = file.read()

# Remove punctuation marks to ensure accurate word lengths
for char in string.punctuation:
    text = text.replace(char, '')

# Split text into individual words
words = text.split()

# Find and print the longest word
if words:
    longest_word = max(words, key=len)
    print(f"Longest word: {longest_word}")
```

	Input	Expected	Got	
✓	input1.txt	Longest word: containing	Longest word: containing	✓
✓	input2.txt	Longest word: thousand	Longest word: thousand	✓
✓	input3.txt	Longest word: supercalifragilisticexpialidocious	Longest word: supercalifragilisticexpialidocious	✓

Passed all tests! ✓

Correct

Marks for this submission: 1.00/1.00.

Question **9**

Correct

Mark 1.00 out of 1.00

Develop a Python program to copy the contents of one file to another file.

Description:

1. **Input:**
   - Source file and destination file names.
2. **Output:**
   - The content of the source file copied to the destination file.

For example:

Test	Input	Result

`with open('output1.txt', 'r') as file:`
`  text = file.read()`
`  print(text)`
	`input1.txt`
	`output1.txt`
		`This is the source file.`
		`It contains multiple lines of text.`
		`Here is another line.`

Answer: (penalty regime: 0 %)

```
# Read source and destination file names from input
source_file = input().strip()
destination_file = input().strip()

# Read content from source file
with open(source_file, 'r') as src:
    content = src.read()

# Write content to destination file
with open(destination_file, 'w') as dest:
    dest.write(content)
```

	Test	Input	Expected	Got	

✓	`with open('output1.txt', 'r') as file:`
	`  text = file.read()`
	`  print(text)`
		`input1.txt`
		`output1.txt`
			`This is the source file.`
			`It contains multiple lines of text.`
			`Here is another line.`
				`This is the source file.`
				`It contains multiple lines of text.`
				`Here is another line.`
					✓

✓	`with open('output2.txt', 'r') as file:`
	`  text = file.read()`
	`  print(text)`
		`input2.txt`
		`output2.txt`
			`Hello, world!`
			`Python programming is amazing.`
			`Let's copy this text to another file.`
				`Hello, world!`
				`Python programming is amazing.`
				`Let's copy this text to another file.`
					✓

✓	`with open('output3.txt', 'r') as file:`
	`  text = file.read()`
	`  print(text)`
		`input3.txt`
		`output3.txt`
			`Single line.`	`Single line.`	✓

Passed all tests! ✓

Correct

Marks for this submission: 1.00/1.00.

Question **10**

Correct

Mark 1.00 out of 1.00

Write a Python program to append a new line at a specific position in a text file, shifting existing lines down.

Description:

1. **Input:**
   - A text file with multiple lines.
   - A line number to insert the new line at.
   - New content for the new line.
2. **Output:**
   - The updated file with the new line inserted at the specified position, shifting the existing lines down in file "output.txt".

Example:

- **Input File Content:**

  "Line one.
  Line two.
  Line three.
  Line four."
  3

  Inserted line..

Output:

Line one.
Line two.
Inserted line.
Line three.
Line four.

For example:

Test	Input	Result

`with open('output.txt', 'r') as file:`
`  text = file.read()`
`  print(text)`
	`input1.txt`
	`3`
	`Inserted line.`
		`Line one.`
		`Line two.`
		`Inserted line.`
		`Line three.`
		`Line four.`

Answer: (penalty regime: 0 %)

```
# Read input parameters
file_name = input().strip()
insert_position = int(input().strip())
new_content = input()

# Read existing lines from the input file
with open(file_name, 'r') as file:
    lines = file.readlines()

# Ensure all existing lines end with a newline character
lines = [line if line.endswith('\n') else line + '\n' for line in lines]

# Convert 1-based position to 0-based index
index = insert_position - 1

# Insert the new line with a newline character
if index < 0:
    lines.insert(0, new_content + '\n')
elif index > len(lines):
    lines.append(new_content + '\n')
else:
    lines.insert(index, new_content + '\n')

# Write the updated lines to output.txt
with open('output.txt', 'w') as file:
    file.writelines(lines)
```

	Test	Input	Expected	Got	

✓	`with open('output.txt', 'r') as file:`
	`  text = file.read()`
	`  print(text)`
		`input1.txt`
		`3`
		`Inserted line.`
			`Line one.`
			`Line two.`
			`Inserted line.`
			`Line three.`
			`Line four.`
				`Line one.`
				`Line two.`
				`Inserted line.`
				`Line three.`
				`Line four.`
					✓

✓	`with open('output.txt', 'r') as file:`
	`  text = file.read()`
	`  print(text)`
		`input2.txt`
		`4`
		`Inserted line D.`
			`Line A.`
			`Line B.`
			`Line C.`
			`Inserted line D.`
				`Line A.`
				`Line B.`
				`Line C.`
				`Inserted line D.`
					✓

Passed all tests! ✓

Correct
